Paving Specialist

Site cleaning - Optimas rotating brush

The Optimas - roller brush is another attachment fitted with hydraulic drive for the Optimas Paver laying machine. The roller brush is locked into position at the front of the Paver laying machine using socket pins and is hung in the arm for height guidance.

The various mechanically angled positions possible mean that the sweeping off of a paved surface, particularly also in curves and at walls, can be carried out with great precision. If required the swept up material can also be gathered in a collector (optional) at the same time.

Working width:	1,80 m
Weight:	140 kg
Drive:	hydraulic
Option:	water container (1000 l) with hose
